TITLE OF THE INVENTION

## INHIBITORS OF FARNESYL-PROTEIN TRANSFERASE

BACKGROUND OF THE INVENTION

- 5           The Ras protein is part of a signalling pathway that links cell surface growth factor receptors to nuclear signals initiating cellular proliferation. Biological and biochemical studies of Ras action indicate that Ras functions like a G-regulatory protein. In the inactive state, Ras is bound to GDP. Upon growth factor receptor activation Ras is
- 10 induced to exchange GDP for GTP and undergoes a conformational change. The GTP-bound form of Ras propagates the growth stimulatory signal until the signal is terminated by the intrinsic GTPase activity of Ras, which returns the protein to its inactive GDP bound form (D.R. Lowy and D.M. Willumsen, *Ann. Rev. Biochem.* 62:851-
- 15 891 (1993)). Mutated *ras* genes are found in many human cancers, including colorectal carcinoma, exocrine pancreatic carcinoma, and myeloid leukemias. The protein products of these genes are defective in their GTPase activity and constitutively transmit a growth stimulatory signal.
- 20           Ras must be localized to the plasma membrane for both normal and oncogenic functions. At least 3 post-translational modifications are involved with Ras membrane localization, and all 3 modifications occur at the C-terminus of Ras. The Ras C-terminus contains a sequence motif termed a "CAAX" or "Cys-Aaa<sup>1</sup>-Aaa<sup>2</sup>-Xaa"
- 25 box (Cys is cysteine, Aaa is an aliphatic amino acid, the Xaa is any amino acid) (Willumsen *et al.*, *Nature* 310:583-586 (1984)). Depending on the specific sequence, this motif serves as a signal sequence for the enzymes farnesyl-protein transferase or geranylgeranyl-protein transferase, which catalyze the alkylation of the
- 30 cysteine residue of the CAAX motif with a C<sub>15</sub> or C<sub>20</sub> isoprenoid, respectively. (S. Clarke., *Ann. Rev. Biochem.* 61:355-386 (1992); W.R. Schafer and J. Rine, *Ann. Rev. Genetics* 30:209-237 (1992)). The Ras protein is one of several proteins that are known to undergo post-translational farnesylation. Other farnesylated proteins include the Ras-

- 2 -

related GTP-binding proteins such as Rho, fungal mating factors, the nuclear lamins, and the gamma subunit of transducin. James, et al., *J. Biol. Chem.* 269, 14182 (1994) have identified a peroxisome associated protein Pxf which is also farnesylated. James, et al., have also suggested  
5 that there are farnesylated proteins of unknown structure and function in addition to those listed above.

Inhibition of farnesyl-protein transferase has been shown to block the growth of Ras-transformed cells in soft agar and to modify other aspects of their transformed phenotype. It has also been  
10 demonstrated that certain inhibitors of farnesyl-protein transferase selectively block the processing of the Ras oncoprotein intracellularly (N.E. Kohl *et al.*, *Science*, 260:1934-1937 (1993) and G.L. James *et al.*, *Science*, 260:1937-1942 (1993). Recently, it has been shown that an inhibitor of farnesyl-protein transferase blocks the growth of *ras*-  
15 dependent tumors in nude mice (N.E. Kohl *et al.*, *Proc. Natl. Acad. Sci U.S.A.*, 91:9141-9145 (1994) and induces regression of mammary and salivary carcinomas in *ras* transgenic mice (N.E. Kohl *et al.*, *Nature Medicine*, 1:792-797 (1995).

Indirect inhibition of farnesyl-protein transferase *in vivo*  
20 has been demonstrated with lovastatin (Merck & Co., Rahway, NJ) and compactin (Hancock *et al.*, *ibid*; Casey *et al.*, *ibid*; Schafer *et al.*, *Science* 245:379 (1989)). These drugs inhibit HMG-CoA reductase, the rate limiting enzyme for the production of polyisoprenoids including farnesyl pyrophosphate. Farnesyl-protein transferase utilizes farnesyl  
25 pyrophosphate to covalently modify the Cys thiol group of the Ras CAAX box with a farnesyl group (Reiss *et al.*, *Cell*, 62:81-88 (1990); Schaber *et al.*, *J. Biol. Chem.*, 265:14701-14704 (1990); Schafer *et al.*, *Science*, 249:1133-1139 (1990); Manne *et al.*, *Proc. Natl. Acad. Sci USA*, 87:7541-7545 (1990)). Inhibition of farnesyl pyrophosphate  
30 biosynthesis by inhibiting HMG-CoA reductase blocks Ras membrane localization in cultured cells. However, direct inhibition of farnesyl-protein transferase would be more specific and attended by fewer side effects than would occur with the required dose of a general inhibitor of isoprene biosynthesis.

- 3 -

Inhibitors of farnesyl-protein transferase (FPTase) have been described in two general classes. The first are analogs of farnesyl diphosphate (FPP), while the second class of inhibitors is related to the protein substrates (e.g., Ras) for the enzyme. The peptide derived  
5 inhibitors that have been described are generally cysteine containing molecules that are related to the CAAX motif that is the signal for protein prenylation. (Schaber *et al.*, *ibid*; Reiss *et al.*, *ibid*; Reiss *et al.*, *PNAS*, 88:732-736 (1991)). Such inhibitors may inhibit protein prenylation while serving as alternate substrates for the farnesyl-protein  
10 transferase enzyme, or may be purely competitive inhibitors (U.S. Patent 5,141,851, University of Texas; N.E. Kohl *et al.*, *Science*, 260:1934-1937 (1993); Graham, *et al.*, *J. Med. Chem.*, 37, 725 (1994)). In general, deletion of the thiol from a CAAX derivative has been shown to dramatically reduce the inhibitory potency of the compound.  
15 However, the thiol group potentially places limitations on the therapeutic application of FPTase inhibitors with respect to pharmacokinetics, pharmacodynamics and toxicity. Therefore, a functional replacement for the thiol is desirable.

It has recently been shown that farnesyl-protein transferase  
20 inhibitors are inhibitors of proliferation of vascular smooth muscle cells and are therefore useful in the prevention and therapy of arteriosclerosis and diabetic disturbance of blood vessels (JP H7-112930). It has also recently been disclosed that certain tricyclic compounds which optionally incorporate a piperidine moiety are  
25 inhibitors of FPTase (WO 95/10514, WO 95/10515 and WO 95/10516).

It is, therefore, an object of this invention to develop novel peptidomimetic compounds that do not have a thiol moiety, and that will inhibit farnesyl-protein transferase and thus, the post-translational farnesylation of proteins. It is a further object of this invention to  
30 develop chemotherapeutic compositions containing the compounds of this invention and methods for producing the compounds of this invention.

**SUMMARY OF THE INVENTION**

The present invention comprises peptidomimetic piperidine, 1,4-dihydropyridine and 1,2,3,4-tetrahydropyridine compounds which inhibit the farnesyl-protein transferase.

- 5 Furthermore, these compounds differ from such heterocyclic compounds previously described as inhibitors of farnesyl-protein transferase with respect to the position of substituents about the nitrogen containing ring. Further contained in this invention are  
 10 chemotherapeutic compositions containing these farnesyl transferase inhibitors and methods for their production.

The compounds of this invention are illustrated by the formulae A:

or an optical isomer or a pharmaceutically acceptable salt thereof.

The compounds of the present invention may have asymmetric centers and occur as racemates, racemic mixtures, and as individual diastereomers, with all possible isomers, including optical

isomers, being included in the present invention. When any variable (e.g. aryl, heterocycle, R<sup>1a</sup>, R<sup>4</sup> etc.) occurs more than one time in any constituent, its definition on each occurrence is independent at every other occurrence. Also, combinations of substituents/or variables are  
5 permissible only if such combinations result in stable compounds.

As used herein, "alkyl" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms; "alkoxy" represents an alkyl group of indicated number of carbon atoms attached through an oxygen  
10 bridge. "Halogen" or "halo" as used herein means fluoro, chloro, bromo and iodo.

As used herein, "aryl" is intended to mean any stable monocyclic, bicyclic or tricyclic carbon ring of up to 7 members in each ring, wherein at least one ring is aromatic. Examples of  
15 monocyclic and bicyclic aryl elements include phenyl, naphthyl, tetrahydronaphthyl, indanyl, biphenyl, phenanthryl, anthryl or acenaphthyl. Examples of tricyclic aryl elements include 10,11-dihydro-5H-dibenzo[a,d]cyclohepten-5-yl (which is also known as dibenzylsuberyl), 9-fluorenyl and 9,10-dihydroanthracen-9-yl.  
20 Preferably, "aryl" is a monocyclic or bicyclic carbon ring.

The term heterocycle or heterocyclic, as used herein, represents a stable 5- to 7-membered monocyclic or stable 8- to 11-membered bicyclic heterocyclic ring or stable 13- to 15-membered tricyclic heterocyclic ring, which is either saturated or unsaturated, and  
25 which consists of carbon atoms and from one to four heteroatoms selected from the group consisting of N, O, and S, and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The heterocyclic ring may be attached at any heteroatom or carbon atom which results in the creation of a stable  
30 structure. Examples of monocyclic and bicyclic heterocyclic elements include, but are not limited to, azepinyl, benzimidazolyl, benzisoxazolyl, benzofurazanyl, benzopyranyl, benzothiopyranyl, benzofuryl, benzothiazolyl, benzothieryl, benzoxazolyl, chromanyl, cinnolinyl, dihydrobenzofuryl, dihydrobenzothieryl, dihydrobenzothiopyranyl,

The 6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridine moiety has the following structure:

Preferably, "heterocyclic" is a monocyclic or bicyclic moiety. As used herein, "heteroaryl" is intended to mean any stable monocyclic, bicyclic or tricyclic carbon ring of up to 7 members in each ring, wherein at least one ring is aromatic and wherein from one to four carbon atoms are replaced by heteroatoms selected from the group consisting of N, O, and S. Examples of monocyclic and bicyclic heteroaryl elements include, but are not limited to, benzimidazolyl, benzisoxazolyl, benzofurazanyl, benzopyranyl, benzothiopyranyl, benzofuryl, benzothiazolyl, benzothiényl, benzoxazolyl, chromanyl, cinnoliny, dihydrobenzofuryl, dihydrobenzothiényl, dihydrobenzothiopyranyl, dihydrobenzothiopyranyl sulfone, furyl, imidazolyl, indoliny, indolyl, isochromanyl, isoindoliny, isoquinoliny, isothiazolyl, naphthyridiny, oxadiazolyl, pyridyl, pyraziny, pyrazolyl, pyridaziny, pyrimidinyl, pyrroly, quinazoliny, quinoliny,

The pharmaceutically acceptable salts of the compounds of this invention include the conventional non-toxic salts of the compounds of this invention as formed, e.g., from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like: and the salts prepared

- 57 -

from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxy-benzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic,

It is intended that the definition of any substituent or variable (e.g., R<sup>1a</sup>, Z, n, etc.) at a particular location in a molecule be independent of its definitions elsewhere in that molecule. Thus, -N(R<sup>8</sup>)<sub>2</sub> represents -NH<sub>2</sub>, -NHCH<sub>3</sub>, -NHC<sub>2</sub>H<sub>5</sub>, etc. It is understood  
10 that substituents and substitution patterns on the compounds of the instant invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art, as well as those methods set forth below, from readily available starting materials.

15 The pharmaceutically acceptable salts of the compounds of this invention can be synthesized from the compounds of this invention which contain a basic moiety by conventional chemical methods. Generally, the salts are prepared either by ion exchange chromatography or by reacting the free base with stoichiometric  
20 amounts or with an excess of the desired salt-forming inorganic or organic acid in a suitable solvent or various combinations of solvents.

The compounds of this invention are prepared by employing reactions as shown in the Schemes 1-21, in addition to other  
15 standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. While stereochemistry is shown in the Schemes, a person of ordinary skill in the art would understand that the  
20 illustrated compounds represent racemic mixtures which may be separated at a subsequent purification step or may be utilized as the racemic mixture.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to  
25 synthesize fragments which are subsequently joined by the reductive alkylation or acylation reactions described in the Schemes.

#### Synopsis of Schemes 1-8:

The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures, for the  
30 most part. In Schemes 1-3, for example, the syntheses of 1,3,5-trisubstituted piperidines are outlined. The reactions described therein may be similarly applied to suitably protected commercially available nipecotic acid or nipecotamide to provide compounds of the instant invention wherein R<sup>3</sup> is hydrogen.

- 59 -

As shown in Scheme 1, the pyridinedicarboxylic acid diester may be catalytically hydrogenated and then N-protected to provide a mixture of piperidine diesters 1. The protected piperidine can then be partially hydrolyzed to provide a racemic mixture of 3,5-  
5 cis- and trans-isomers, that can be separated by chromatography. The remainder of Scheme 1 and Schemes 2 and 3 illustrate manipulation of the racemic mixture of the cis-isomers. It is well understood by one of ordinary skill in the art that such chemical manipulations can also be applied to the racemic mixture of the trans-isomers to obtain other  
10 compounds of the instant invention. Furthermore, such manipulations can also be applied to enantiomerically pure isomers (i.e., the (+)-cis isomer or the (-)-cis isomer). The trans-isomer may also be epimerized to the cis-isomer by treatment with a base, such as sodium carbonate. Racemic final compounds may be separated on a chiral preparative  
15 HPLC column to give their respective diastereomers.

The monocarboxylic acid 2 can be treated with an appropriately substituted amine in the presence of a suitable coupling reagent, such as EDC/HOBT, and the like, to provide the 5-  
20 carboxynipecotamide 3. The suitably substituted 5-carboxynipecotamide is then deprotected and the piperidine nitrogen can then be reductively alkylated to provide intermediate 4. The remaining ester moiety is saponified and then similarly functionalized with another suitably substituted amine to provide the bisamidopiperidine 5.

25 An alternative synthetic route to compound 5, starting with the carboxynipecotamide 3, is illustrated in Scheme 2.

As shown in Scheme 3, the monocarboxylic acid 2 can undergo a Curtius rearrangement to provide the piperidine 6 after catalytic reduction. Subsequent amide formation provides intermediate 7, which is then subjected to the reactions illustrated in Scheme 1 to  
30 provide compound 8 of the instant invention.

The instant invention also includes 1,4-dihydropyridine and 1,2,3,4-tetrahydropyridine analogs of the piperidine compounds whose syntheses are described above. Scheme 4 illustrates the synthetic route to the intermediates 11 and 13 which correspond to the saturated ring

- 60 -

intermediate 2 illustrated in Scheme 1. Thus, the appropriately substituted pyridine may be N-alkylated to provide the quaternary intermediate 9. Subsequent reduction of this intermediate provides the 1,4-dihydropyridine 10, which can be selectively hydrolized to the key intermediate 11. Alternatively, the 1,4-dihydropyridine 10 can be further reduced to provide the enantiomeric mixture of tetrahydropyridines 12, which can be hydrolized and resolved by chromatography to provide the key intermediate 13 (and the enantiomer which is not illustrated). Intermediates 11 and 13 can then undergo synthetic modifications as described hereinabove in Schemes 1-3.

Schemes 5-7 illustrate the syntheses of 1,3-disubstituted piperidines of the instant invention wherein the "X" moiety is other than an amido moiety. The reactions illustrated therein may be modified by using appropriate protecting groups and reagents well known to one skilled in the art to provide 1,3,5-trisubstituted piperidines of the instant invention.

Scheme 5 illustrates the syntheses of compounds of the instant invention wherein "X" is -S- or -SO<sub>2</sub>-. A racemic nipecotate 14 can be resolved by the selective crystallization of chiral tartrate salts and is then reductively alkylated to provide the ester 15. Intermediate 15 is reduced to the alcohol 16, activated and treated with a suitable thioacetate to provide the thioester 17. The thiol is then generated and may be alkylated and optionally oxidized to provide compounds 18 and 19 of the instant invention.

The intermediate 16 may be selectively oxidized back to an aldehyde, which can then be utilized to reductively alkylate a suitably substituted amine to provide the instant compound 20. The secondary amine of 20 can be further functionalized as illustrated.

The activated alcohol can also be reacted with a suitably substituted imidazolyl to provide compounds of the instant invention wherein "X" is a bond, as shown in Scheme 7.

Scheme 8 illustrates the syntheses of compounds of the instant invention wherein R<sup>2</sup> is an aryl moiety.

In the above Schemes it is understood that

or a protected precursor thereof;

- 5  $R^{Sc}CH_2-$  is  $R^2$  or a protected precursor thereof; and  
 $R^{Sb}-$  is  $R^6$  or a protected precursor thereof; and  
 $R-$  is a "substituent" or a protected precursor thereof.

It is understood that a variety of amines and acids, either commercially available or readily synthesized by reactions well known in the art, which contain the side-chain moieties  $R^{Sa}$  and  $R^{Sd}(C=O)$  may be utilized in the reactions described hereinabove. Schemes 9-21 illustrate specific reactions wherein such intermediates containing the side-chain moieties  $R^{Sa}$  and  $R^{Sd}(C=O)$  may be prepared. It is understood that while Schemes 9-21 illustrate preparation of both protected and unprotected intermediates, a person of ordinary skill would appreciate that subsequent reactions which utilize those intermediates, such as those described in Schemes 1-8, may require protection and eventual deprotection of certain intermediate moieties..

The selectively protected intermediate 20 utilized in the synthesis illustrated in Scheme 9 can be reductively alkylated with a variety of aldehydes, such as 21. The aldehydes can be prepared by standard procedures, such as that described by O. P. Goel, U. Krolls, M. Stier and S. Kesten in Organic Syntheses, 1988, 67, 69-75. The reductive alkylation can be accomplished at pH 5-7 with a variety of reducing agents, such as sodium triacetoxyborohydride or sodium cyanoborohydride in a solvent such as dichloroethane, methanol or dimethylformamide. The ester product 22 can be deprotected with trifluoroacetic acid in methylene chloride to give the substituted diamine 23. That diamine may be isolated in the salt form, for example, as a

- 72 -

trifluoroacetate, hydrochloride or acetate salt, among others. The product diamine 23 can be further selectively protected and reductively alkylated with a second aldehyde to obtain an analogous tertiary amine. Alternatively, the diamine 23 can be cyclized to obtain intermediates  
5 such as the dihydroimidazole 24 by procedures known in the literature. The ester 24 can then be utilized in a reaction such as illustrated in Scheme 3 hereinabove or can be converted to the amine 26, via the azido intermediate 25. That amine can then be utilized in reactions such as illustrated in Scheme 1.

10 Scheme 10 illustrates preparation of aralkyl imidazolyl intermediates 31 that can be utilized in reactions such as illustrated in Scheme 3. Thus imidazole acetic acid 27 can be converted to the protected acetate 29 by standard procedures, and 29 can be first reacted with an alkyl halide, then treated with refluxing methanol to provide the  
15 regiospecifically alkylated imidazole acetic acid ester 30. Hydrolysis provides the acetic acid 31.

Alternatively, intermediate 31 can be converted into the homologous amine 34 via the azido intermediate 33, as shown in Scheme 11. This amine can then be utilized in reactions such as  
20 illustrated in Scheme 1.

Preparation of amine intermediates having mixed heteroatom substitution is illustrated in Schemes 12 and 13. Thus the protected serine 35 can be reduced to the alcohol 36, which can then undergo a Mitsunobu reaction to provide the phthalimidyl intermediate  
25 37. Deprotection and selective reprotection give the alcohol 39, which can be oxidized to the aldehyde 40. The aldehyde 40 can be subsequently alkylated and finally deprotected to provide the amine intermediate 41.

The Boc protected phthalimidyl alcohol 39 can also be  
30 utilized to synthesize 2-aziridinylmethylamines such as 42 (Scheme 13). Treating 39 with 1,1'-sulfonyldiimidazole and sodium hydride in a solvent such as dimethylformamide led to the formation of aziridine 42. The aziridine may then be reacted in the presence of a nucleophile, such

- 73 -

as a thiol, in the presence of base to yield, after deprotection, the ring-opened intermediate amine 43.

In addition, amines such as 48 derived from amino acids such as O-alkylated tyrosines can be prepared according to standard  
5 procedures as shown in Scheme 14. Illustrated is a procedure where the amine moiety is derived from the azide of an intermediate such as 47.

Schemes 15-18 illustrate syntheses of suitably substituted alkanols useful in the syntheses of the instant compounds wherein the variable W is present as a pyridyl moiety. The hydroxyl moiety of such  
10 intermediates may be converted into the corresponding amine, as illustrated in Scheme 15 or may be converted to a suitable leaving group, as illustrated in Scheme 17. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art.

15 Compounds of the instant invention wherein the  $A^1(CR^1a_2)_nA^2(CR^1a_2)_n$  linker is a substituted methylene may be synthesized by the methods shown in Scheme 19. Thus, the N-protected imidazolyl iodide 50 is reacted, under Grignard conditions with a suitably protected benzaldehyde to provide the alcohol 51. Acylation,  
20 followed by the alkylation procedure illustrated in the Schemes above (in particular, Scheme 7) provides the instant compound 52. If other  $R^1$  substituents are desired, the acetyl moiety can be manipulated as illustrated in the Scheme.

Scheme 20 illustrates synthesis of an instant compound  
25 wherein a non-hydrogen  $R^{5b}$  is incorporated in the instant compound. Thus, a readily available 4-substituted imidazole 53 may be selectively iodinated to provide the 5-iodoimidazole 54. That imidazole may then be protected and coupled to a suitably substituted benzyl moiety to provide intermediate 55. Intermediate 55 can then undergo the  
30 alkylation reactions that were described hereinabove.

Compounds of the instant invention wherein the  $A^1(CR^1_2)_nA^2(CR^1_2)_n$  linker is oxygen may be synthesized by methods known in the art, for example as shown in Scheme 21. The suitably substituted phenol 56 may be reacted with methyl N-

- 74 -

(cyano)methanimidate to provide the 4-phenoxyimidazole **57**. After selective protection of one of the imidazolyl nitrogens, the intermediate **58** can undergo alkylation reactions as described for the benzylimidazoles hereinabove.

The instant compounds are useful as pharmaceutical agents for mammals, especially for humans. These compounds may be administered to patients for use in the treatment of cancer. Examples of the type of cancer which may be treated with the compounds of this invention include, but are not limited to, colorectal carcinoma, exocrine pancreatic carcinoma, myeloid leukemias and neurological tumors. Such tumors may arise by mutations in the *ras* genes themselves, mutations in the proteins that can regulate Ras activity (i.e., neurofibromin (NF-1), neu, scr, abl, lck, fyn) or by other mechanisms.

The compounds of the instant invention inhibit farnesyl-protein transferase and the farnesylation of the oncogene protein Ras. The instant compounds may also inhibit tumor angiogenesis, thereby affecting the growth of tumors (J. Rak et al. *Cancer Research*, 55:4575-4580 (1995)). Such anti-angiogenesis properties of the instant compounds may also be useful in the treatment of certain forms of blindness related to retinal vascularization.

The compounds of this invention are also useful for inhibiting other proliferative diseases, both benign and malignant, wherein Ras proteins are aberrantly activated as a result of oncogenic mutation in other genes (i.e., the Ras gene itself is not activated by mutation to an oncogenic form) with said inhibition being accomplished by the administration of an effective amount of the compounds of the invention to a mammal in need of such treatment. For example, a component of NF-1 is a benign proliferative disorder.

The instant compounds may also be useful in the treatment of certain viral infections, in particular in the treatment of hepatitis delta and related viruses (J.S. Glenn et al. *Science*, 256:1331-1333 (1992)).

The compounds of the instant invention are also useful in the prevention of restenosis after percutaneous transluminal coronary angioplasty by inhibiting neointimal formation (C. Indolfi et al. *Nature medicine*, 1:541-545(1995)).

The instant compounds may also be useful in the treatment and prevention of polycystic kidney disease (D.L. Schaffner et al.

- 93 -

*American Journal of Pathology*, 142:1051-1060 (1993) and B. Cowley, Jr. et al. *FASEB Journal*, 2:A3160 (1988)).

The instant compounds may also be useful for the treatment of fungal infections.

5           The compounds of this invention may be administered to mammals, preferably humans, either alone or, preferably, in combination with pharmaceutically acceptable carriers or diluents, optionally with known adjuvants, such as alum, in a pharmaceutical composition, according to standard pharmaceutical practice. The  
10       compounds can be administered orally or parenterally, including the intravenous, intramuscular, intraperitoneal, subcutaneous, rectal and topical routes of administration.

          For oral use of a chemotherapeutic compound according to this invention, the selected compound may be administered, for  
15       example, in the form of tablets or capsules, or as an aqueous solution or suspension. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch, and lubricating agents, such as magnesium stearate, are commonly added. For oral  
20       administration in capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring agents may be added. For intramuscular, intraperitoneal, subcutaneous and intravenous use,  
25       sterile solutions of the active ingredient are usually prepared, and the pH of the solutions should be suitably adjusted and buffered. For intravenous use, the total concentration of solutes should be controlled in order to render the preparation isotonic.

          The present invention also encompasses a pharmaceutical composition useful in the treatment of cancer, comprising the  
30       administration of a therapeutically effective amount of the compounds of this invention, with or without pharmaceutically acceptable carriers or diluents. Suitable compositions of this invention include aqueous solutions comprising compounds of this invention and pharmacologically acceptable carriers, e.g., saline, at a pH level, e.g., 7.4. The

- 94 -

solutions may be introduced into a patient's intramuscular blood-stream by local bolus injection.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specific amounts, as well as any product which results, directly or indirectly,  
5 from combination of the specific ingredients in the specified amounts.

When a compound according to this invention is administered into a human subject, the daily dosage will normally be determined by the prescribing physician with the dosage generally  
10 varying according to the age, weight, and response of the individual patient, as well as the severity of the patient's symptoms.

In one exemplary application, a suitable amount of compound is administered to a mammal undergoing treatment for cancer. Administration occurs in an amount between about 0.1 mg/kg  
15 of body weight to about 60 mg/kg of body weight per day, preferably of between 0.5 mg/kg of body weight to about 40 mg/kg of body weight per day.

The compounds of the instant invention are also useful as a component in an assay to rapidly determine the presence and  
20 quantity of farnesyl-protein transferase (FPTase) in a composition. Thus the composition to be tested may be divided and the two portions contacted with mixtures which comprise a known substrate of FPTase (for example a tetrapeptide having a cysteine at the amine terminus) and farnesyl pyrophosphate and, in one of the mixtures, a  
25 compound of the instant invention. After the assay mixtures are incubated for an sufficient period of time, well known in the art, to allow the FPTase to farnesylate the substrate, the chemical content of the assay mixtures may be determined by well known immunological, radiochemical or chromatographic techniques.  
30 Because the compounds of the instant invention are selective inhibitors of FPTase, absence or quantitative reduction of the amount of substrate in the assay mixture without the compound of the instant invention relative to the presence of the unchanged substrate in the

- 95 -

assay containing the instant compound is indicative of the presence of FPTase in the composition to be tested.

It would be readily apparent to one of ordinary skill in the art that such an assay as described above would be useful in identifying tissue samples which contain farnesyl-protein transferase and quantitating the enzyme. Thus, potent inhibitor compounds of the instant invention may be used in an active site titration assay to determine the quantity of enzyme in the sample. A series of samples composed of aliquots of a tissue extract containing an unknown amount of farnesyl-protein transferase, an excess amount of a known substrate of FPTase (for example a tetrapeptide having a cysteine at the amine terminus) and farnesyl pyrophosphate are incubated for an appropriate period of time in the presence of varying concentrations of a compound of the instant invention. The concentration of a sufficiently potent inhibitor (i.e., one that has a  $K_i$  substantially smaller than the concentration of enzyme in the assay vessel) required to inhibit the enzymatic activity of the sample by 50% is approximately equal to half of the concentration of the enzyme in that particular sample.

### EXAMPLES

Examples provided are intended to assist in a further understanding of the invention. Particular materials employed, species and conditions are intended to be further illustrative of the invention and not limitative of the reasonable scope thereof. Purification by HPLC or column chromatography was utilized for each of the Examples 1-24 as set forth below.

- 96 -

EXAMPLE 1

Preparation of 1-(t-Butoxycarbonyl)-*cis*-3-methoxycarbonyl-5-[N-(1-(4-cyanobenzyl)-1H-imidazol-5-ylethyl)carbamoyl] piperidine

5

Step A: Preparation of Pyridine-3,5-dicarboxylic acid methyl ester hydrochloride

Pyridine-3,5-dicarboxylic acid (5.00 g, 29.9 mmol) was stirred in CH<sub>3</sub>OH (100 mL), cooled in an ice bath, and treated dropwise with thionyl chloride (17.45 mL, 239.2 mmol). After 0.5 hr, the reaction mixture was refluxed for 48 hrs. Concentration to dryness gave the title compound as an off-white solid.

10

Step B: Preparation of Piperidine-*cis*, *trans*-3,5-dicarboxylic acid methyl ester hydrochloride

15

Pyridine-3,5-dicarboxylic acid methyl ester hydrochloride (7.07 g, 30.5 mmol) was dissolved in acetic acid (75 mL), treated with platinum(IV) oxide (100 mg, 0.44 mmol) and shaken on a Parr apparatus at 50 psi overnight. The reaction mixture was filtered through celite and concentrated to dryness to give the title compound.

20

Step C: Preparation of 1-(t-Butoxycarbonyl)piperidine-*cis* and *trans*-3,5-dicarboxylic acid methyl ester

Piperidine-3,5-dicarboxylic acid methyl ester hydrochloride (7.11 g, 29.9 mmol) was dissolved in THF (60 mL) and H<sub>2</sub>O (60 mL). Sodium bicarbonate (13.81 g, 0.164 mol) was added followed by di-*tert*-butyl dicarbonate (9.79 g, 44.9 mmol). The mixture was stirred at ambient temperature for 5 hrs. The THF was removed under reduced pressure, and the solution was extracted with CH<sub>2</sub>Cl<sub>2</sub> (3x100 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> layers were washed with brine and dried (MgSO<sub>4</sub>). Filtration and concentration to dryness gave,

25

30

- 97 -

after chromatography (silica gel, 10% ethyl acetate/hexane), racemic 1-(t-Butoxycarbonyl)piperidine-*cis*-3,5-dicarboxylic acid methyl ester and racemic 1-(t-Butoxycarbonyl)piperidine-*trans*-3,5-dicarboxylic acid methyl ester.

5

Step D: Preparation of 1-(t-Butoxycarbonyl)-*cis*-3-methoxycarbonyl-piperidine-5-carboxylic acid

1-(t-Butoxycarbonyl)piperidine-*cis*-3,5-dicarboxylic acid methyl ester (0.761 g, 2.52 mmol) was dissolved in DME (6 mL) and  
10 H<sub>2</sub>O (6 mL) followed by addition of LiOH·H<sub>2</sub>O (0.106 g, 2.52 mmol). The mixture was stirred at ambient temperature overnight. The DME was removed under reduced pressure, taken up in EtOAc and water, acidified to pH 3, and extracted with EtOAc (10X). The EtOAc layers were combined, dried (MgSO<sub>4</sub>), filtered, and concentrated to dryness to  
15 give the title compound after chromatography (silica gel, 1-3% MeOH/CH<sub>2</sub>Cl<sub>2</sub>).

Step E: Preparation of 3-(4-cyanobenzyl) histamine

NY-Pivaloyloxymethyl-N $\alpha$ -phthaloylhistamine (4.55 g, 12.8  
20 mmol) was prepared as previously described (J. C. Emmett, F. H. Holloway, and J. L. Turner, *J. Chem. Soc., Perkin Trans. 1*, 1341, (1979)).  $\alpha$ -Bromo-p-tolunitrile (3.77 g, 19.2 mmol) was dissolved in acetonitrile (70 mL). The solution was heated at 55°C for 4 h, cooled to room temperature, and filtered to remove the white solid. The  
25 acetonitrile (30 mL) was concentrated to 1/2 its volume under reduced pressure and the solution was heated at 55°C overnight. The solution was cooled and filtered to give a white solid. The volume of the filtrate was reduced to 10 mL, the solution was heated at 55°C for 1 hr, then cooled to room temperature, diluted with EtOAc (25 mL) and filtered  
30 to obtain additional white solid. The solids were combined, dried, and used without further purification.

1-Pivaloyloxymethyl-3-(4-cyanobenzyl)-4-(2-phthalimidoethyl)imidazolium bromide (6.13 g, 11.1 mmol) in methanol (100 mL) was saturated with ammonia gas while the

temperature was maintained below 30°C. The solution was stirred for 1 hr, concentrated to dryness, and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3x200 mL), dried (MgSO<sub>4</sub>), concentrated, and chromatographed (silica gel, 10:90:1 MeOH/CH<sub>2</sub>Cl<sub>2</sub>/NH<sub>4</sub>OH) to give 4-cyanobenzyl-N $\alpha$ -phthaloylhistamine.

5                    3-(4-Cyanobenzyl)-N $\alpha$ -phthaloylhistamine (1.64 g, 4.61 mmol), and hydrazine (1.46 mL, 46.1 mmol) were dissolved in absolute EtOH (70 mL). The solution was concentrated after 1 hr and filtered to remove a white precipitate which was washed several times with EtOH. The filtrate was concentrated and the residue was chromatographed  
10 (silica gel, 10:90:1 MeOH/CH<sub>2</sub>Cl<sub>2</sub>/NH<sub>4</sub>OH) to give the title compound.

Step F:            Preparation of 1-(t-Butoxycarbonyl)-*cis*-3-methoxycarbonyl-5-[N-(1-(4-cyanobenzyl)-1H-imidazol-5-ylethyl)carbonyl]-piperidine

15                    1-t-Butoxycarbonyl-*cis*-3-methoxycarbonyl-piperidine-5-carboxylic acid (1.45 g, 5.06 mmol), 3-(4-cyanobenzyl) histamine (1.14 g, 5.06 mmol), HOBt (0.72 g, 5.31 mmol), EDC (1.02 g, 5.31 mmol), Et<sub>3</sub>N (0.63 mL, 4.55 mmol) were dissolved in DMF (20 mL). The solution was stirred overnight, concentrated, and partitioned between  
20 EtOAc (300 mL) and sat NaHCO<sub>3</sub> solution (200 mL). The organics were washed with brine, dried (MgSO<sub>4</sub>), filtered and concentration to dryness gave the title compound after chromatography (silica gel, 1-2% MeOH/CHCl<sub>3</sub>). <sup>1</sup>H NMR (CDCl<sub>3</sub>);  $\delta$  7.64 (d, 2H, J=8 Hz), 7.52 (s, 1H), 7.14 (d, 2H, J=8 Hz), 6.90 (s, 1H), 6.12 (br s, 1H), 5.21 (s, 2H),

The solution was concentrated to remove ethanol and the remaining aqueous solution was decanted from the green oil. The oil was washed with water (2X) and decanted. The oil was dried under reduced pressure to give the title compound without further purification.

Step E: Preparation of 1-(2,2-Diphenylethyl)-3(S)-  
mercaptomethyl-piperidine

The disulfide (0.10 g, 0.161 mmol) was dissolved in acetone (15mL) and 10% aq. MeOH (10mL). Tributyl phosphine (0.261 mL, 0.322 mmol) was . The solution was stirred for 2 hr, concentrated, and the residue was taken up in EtOAc, washed with satd

A white solid precipitated from the solution. Chlorotriphenylmethane (76.1 g, 273 mmol) in of DMF (500 mL) was added dropwise. The reaction mixture was stirred for 20 hrs, poured over ice, filtered, and washed with ice water. The resulting product was slurried with cold dioxane, filtered, and dried *in vacuo* to provide the title compound as a white solid which was sufficiently pure for use in the next step.

15      Step G:      Preparation of 1-Triphenylmethyl-4-(acetoxymethyl)-imidazole

5 dissolved in methanol (500mL), and warmed to 60 °C. After 2hrs, the solution was concentrated *in vacuo* to provide a white solid which was triturated with hexane to remove soluble materials. Removal of residual solvents *in vacuo* provided the titled product hydrobromide as a white solid which was used in the next step without further purification.

10

NaHCO<sub>3</sub> solution was added to give a pH of 8 and the solution was extracted with EtOAc (2 x 250 mL), dried (MgSO<sub>4</sub>) and the solvent evaporated in vacuo. The residue was chromatographed (Silica gel, 0-20% EtOAc in CH<sub>2</sub>Cl<sub>2</sub>) to afford the title compound as a white solid.

##### 15 In vitro inhibition of ras farnesyl transferase

*Assays of farnesyl-protein transferase.* Partially purified bovine FPTase and Ras peptides (Ras-CVLS, Ras-CVIM and Ras-CAIL) were prepared as described by Schaber *et al.*, *J. Biol. Chem.* 265:14701-14704 (1990), Pompliano, *et al.*, *Biochemistry* 31:3800 (1992) and Gibbs *et al.*, *PNAS U.S.A.* 86:6630-6634 (1989), respectively. Bovine FPTase was assayed in a volume of 100  $\mu\text{l}$  containing 100 mM *N*-(2-hydroxy ethyl) piperazine-*N'*-(2-ethane sulfonic acid) (HEPES), pH 7.4, 5 mM  $\text{MgCl}_2$ , 5 mM dithiothreitol (DTT), 100 mM [ $^3\text{H}$ ]-farnesyl diphosphate ([ $^3\text{H}$ ]-FPP; 740 CBq/mmol, New England Nuclear), 650 nM Ras-CVLS and 10  $\mu\text{g/ml}$  FPTase at 31°C for 60 min. Reactions were initiated with FPTase and stopped with 1 ml of 1.0 M HCL in ethanol. Precipitates were collected onto filter-mats using a TomTec Mach II cell harvester, washed with 100% ethanol, dried and counted in an LKB  $\beta$ -plate counter. The assay was linear with respect to both substrates, FPTase levels and time; less than 10% of the [ $^3\text{H}$ ]-FPP was utilized during the reaction period. Purified compounds were dissolved in 100% dimethyl sulfoxide (DMSO) and were diluted 20-fold into the assay. Percentage inhibition is measured by the amount of incorporation of radioactivity in the presence of the test compound

- 141 -

when compared to the amount of incorporation in the absence of the test compound.

Human FPTase was prepared as described by Omer *et al.*, Biochemistry 32:5167-5176 (1993). Human FPTase activity was  
5 assayed as described above with the exception that 0.1% (w/v) polyethylene glycol 20,000, 10  $\mu$ M ZnCl<sub>2</sub> and 100 nM Ras-CVIM were added to the reaction mixture. Reactions were performed for 30 min., stopped with 100  $\mu$ l of 30% (v/v) trichloroacetic acid (TCA) in ethanol and processed as described above for the bovine enzyme.

10 The compounds of the instant invention that are described in Example 1-24 were tested for inhibitory activity against human FPTase by the assay described above and were found to have IC<sub>50</sub> of < 10  $\mu$ M.

## 15 EXAMPLE 26

### In vivo ras farnesylation assay

The cell line used in this assay is a v-ras line derived from either Rat1 or NIH3T3 cells, which expressed viral Ha-ras p21. The  
20 assay is performed essentially as described in DeClue, J.E. *et al.*, Cancer Research 51:712-717, (1991). Cells in 10 cm dishes at 50-75% confluency are treated with the test compound (final concentration of solvent, methanol or dimethyl sulfoxide, is 0.1%). After 4 hours at 37°C, the cells are labelled in 3 ml methionine-free DMEM supplemented with 10% regular DMEM, 2% fetal bovine serum and 400  
25 mCi[<sup>35</sup>S]methionine (1000 Ci/mmol). After an additional 20 hours, the cells are lysed in 1 ml lysis buffer (1% NP40/20 mM HEPES, pH 7.5/5 mM MgCl<sub>2</sub>/1mM DTT/10 mg/ml aprotinen/2 mg/ml leupeptin/2 mg/ml antipain/0.5 mM PMSF) and the lysates cleared by centrifugation at  
30 100,000 x g for 45 min. Aliquots of lysates containing equal numbers of acid-precipitable counts are brought to 1 ml with IP buffer (lysis buffer lacking DTT) and immunoprecipitated with the ras-specific monoclonal antibody Y13-259 (Furth, M.E. *et al.*, J. Virol. 43:294-304, (1982)). Following a 2 hour antibody incubation at 4°C, 200 ml of a

- 142 -

25% suspension of protein A-Sepharose coated with rabbit anti rat IgG is added for 45 min. The immunoprecipitates are washed four times with IP buffer (20 nM HEPES, pH 7.5/1 mM EDTA/1% Triton X-100.0.5% deoxycholate/0.1%/SDS/0.1 M NaCl) boiled in SDS-PAGE sample buffer and loaded on 13% acrylamide gels. When the dye front reached the bottom, the gel is fixed, soaked in Enlightening, dried and autoradiographed. The intensities of the bands corresponding to farnesylated and nonfarnesylated ras proteins are compared to determine the percent inhibition of farnesyl transfer to protein.

#### EXAMPLE 27

##### *In vivo* growth inhibition assay

To determine the biological consequences of FPTase inhibition, the effect of the compounds of the instant invention on the anchorage-independent growth of Rat1 cells transformed with either a *v-ras*, *v-raf*, or *v-mos* oncogene is tested. Cells transformed by *v-Raf* and *v-Mos* maybe included in the analysis to evaluate the specificity of instant compounds for Ras-induced cell transformation.

Rat 1 cells transformed with either *v-ras*, *v-raf*, or *v-mos* are seeded at a density of  $1 \times 10^4$  cells per plate (35 mm in diameter) in a 0.3% top agarose layer in medium A (Dulbecco's modified Eagle's medium supplemented with 10% fetal bovine serum) over a bottom agarose layer (0.6%). Both layers contain 0.1% methanol or an appropriate concentration of the instant compound (dissolved in methanol at 1000 times the final concentration used in the assay). The cells are fed twice weekly with 0.5 ml of medium A containing 0.1% methanol or the concentration of the instant compound. Photomicrographs are taken 16 days after the cultures are seeded and comparisons are made.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US96/18811

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☒ Claims Nos.: 1-39 (in part)  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

Please See Extra Sheet.

3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

### BOX I. OBSERVATIONS WHERE CLAIMS WERE FOUND UNSEARCHABLE

#### 2. Where no meaningful search could be carried out, specifically:

The multitude of variables and their permutations and combinations (e.g. R2, R3, R4, R5, R6, R7, V, W, X, etc.) result in claimed subject matter that is so broad in scope that it is rendered virtually incomprehensible and thus no meaningful search can be given. Note also that the claimed subject matter lacks a significant structural element qualifying as the special technical feature that clearly defines a contribution over the art. The subject matter claimed contains a -N- group which does not define a contribution over the prior art. Therefore, the first discernable invention as found in Example 1 (the compound therein, the pharmaceutical composition therewith, the method treating colorectal carcinoma) has been searched.
